VITAMIN D RECEPTOR MODULATORS

BACKGROUND OF THE INVENTION

5 Vitamin D₃ Receptor (VDR) is a ligand dependent transcription factor that belongs to the superfamily of nuclear hormone receptors. The VDR protein is 427 amino acids, with a molecular weight of ~50 kDa. The VDR ligand, 1 α ,25-dihydroxyvitamin D₃ (the hormonally active form of Vitamin D) has its action mediated by its interaction with the nuclear receptor known as Vitamin D receptor ("VDR"). The VDR ligand, 1 α ,25-

10 dihydroxyvitamin D₃ (1 α ,25(OH)₂D₃) acts upon a wide variety of tissues and cells both related to and unrelated to calcium and phosphate homeostasis.

The activity 1 α ,25-dihydroxyvitamin D₃ in various systems suggests wide clinical applications. However, use of conventional VDR ligands is hampered by their associated toxicity, namely hypercalcemia (elevated serum calcium). Currently, 1 α ,25(OH)₂D₃,

15 marketed as Rocaltrol® pharmaceutical agent (product of Hoffmann-La Roche), is administered to kidney failure patients undergoing chronic kidney dialysis to treat hypocalcemia and the resultant metabolic bone disease. Other therapeutic agents, such as Calcipotriol® (synthetic analog of 1 α ,25(OH)₂D₃) show increased separation of binding affinity on VDR from hypercalcemic activity.

20 Recently, chemical modifications of 1 α ,25(OH)₂D₃ have yielded analogs with attenuated calcium mobilization effects (R. Bouillon et. al., Endocrine Rev. 1995, 16, 200-257). One such analog, Dovonex ® pharmaceutical agent (product of Bristol-Meyers Squibb Co.), is currently used in Europe and the United States as a topical treatment for mild to moderate psoriasis (K. Kragballe et. al., Br. J. Dermatol. 1988, 119, 223-230).

25 Other Vitamin D₃ mimics have been described in the publication, Vitamin D Analogs: Mechanism of Action of Therapeutic Applications, by Nagpal, S.; Lu, J.; Boehm, M. F., Curr. Med. Chem. 2001, 8, 1661-1679.

-2-

Although some degree of separation between the beneficial action and calcium raising (calcemic) effects has been achieved with these VDR ligands, to date the separation has been insufficient to allow for oral administration to treat conditions such as osteoporosis, cancers, leukemias, and severe psoriasis.

One example of a major class of disorder that could benefit from VDR mediated biological efficacy in the absence of hypercalcemia is osteoporosis. Osteoporosis is a systemic disorder characterized by decreased bone mass and microarchitectural deterioration of bone tissue leading to bone fragility and increased susceptibility to fractures of the hip, spine, and wrist (World Health Organization WHO 1994). Osteoporosis affects an estimated 75 million people in the United States, Europe, and Japan.

Within the past few years, several antiresorptive therapies have been introduced. These include bisphosphonates, hormone replacement therapy (HRT), a selective estrogen receptor modulator (SERM), and calcitonins. These treatments reduce bone resorption, bone formation, and increase bone density. However, none of these treatments increase true bone volume nor can they restore lost bone architecture.

Synthetic VDR ligands with reduced calcemic potential have been synthesized. For example, a class of bis-phenyl compounds stated to mimic 1α , 25-dihydroxyvitamin D_3 is described in US Patent No. 6,218,430 and the article; "Novel nonsecosteroidal vitamin D mimics exert VDR-modulating activities with less calcium mobilization than 1α , 25-Dihydroxyvitamin D_3 " by Marcus F. Boehm, et. al., Chemistry & Biology 1999, Vol 6, No. 5, pgs. 265-275.

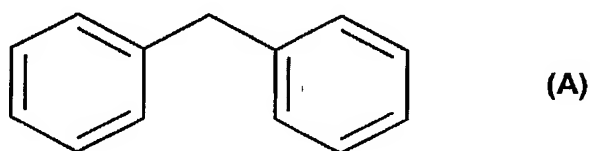

Synthetic VDR ligands having an aryl-thiophene nucleus are described in United States provisional patent application SN 60/384151, filed 29 May 2002.

There remains a need for improved treatments using alternative or improved pharmaceutical agents that mimic 1α , 25-dihydroxyvitamin D_3 to stimulate bone formation, restore bone quality, and treat other diseases without the attendant disadvantage of hypercalcemia.

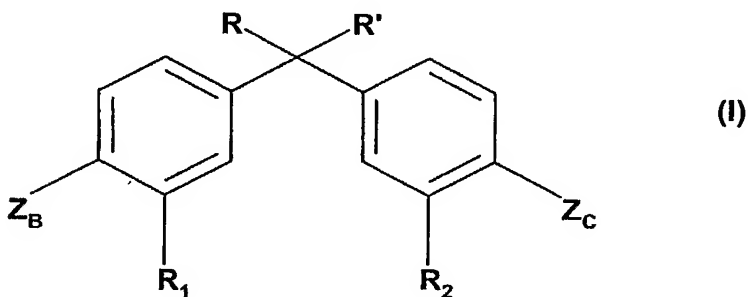

-3-

SUMMARY OF THE INVENTION

Novel compounds having a nucleus of formula "(A)" have been found effective as
5 Vitamin D Receptor (VDR) modulators:

The compounds of the invention with VDR modulating activities are represented by
formula (I)

10

wherein the variables R, R', R₁, R₂, Z_B, and Z_C are as hereinafter defined. It is a
discovery of this invention that compounds described herein display the desirable cell
differentiation and antiproliferative effects of 1,25(OH)₂D₃ with reduced calcium
mobilization (calcemic) effects if substituent Z_C possesses a carbon atom linked group
15 that is directly connected (i.e., with no intervening non-carbon atom) to the aryl nucleus.

In another aspect, the present invention is directed towards pharmaceutical
compositions containing pharmaceutically effective amounts of compounds of
formulae I or a pharmaceutically acceptable salt or prodrug thereof, either singly or in
combination, together with pharmaceutically acceptable carriers and/or auxiliary agents.

20 Another aspect of the invention is a pharmaceutical formulation for treatment or
prevention of osteoporosis containing pharmaceutically effective amounts of the vitamin
D receptor modulator compound of formula (I) together with pharmaceutically effective
amounts of co-agents conventionally used for the treatment of osteoporosis.

Another aspect of the invention is a pharmaceutical formulation for treatment or

-4-

prevention of psoriasis containing pharmaceutically effective amounts of the vitamin D receptor modulator compound of formula (I) together with pharmaceutically effective amounts of co-agents conventionally used for the treatment of psoriasis.

Another aspect of the invention is to use the compounds of the invention to treat
5 disease states responsive to Vitamin D receptor ligands.

Another aspect of the invention is the prevention and treatment of acne, actinic keratosis, alopecia, Alzheimer's disease, autoimmune induced diabetes, bone fracture healing, breast cancer, Crohn's disease, prostate cancer, colon cancer, Type I diabetes, host-graft rejection, hypercalcemia, Type II diabetes, leukemia, multiple sclerosis,
10 insufficient sebum secretion, osteomalacia, osteoporosis, insufficient dermal firmness, insufficient dermal hydration, myelodysplastic syndrome, psoriatic arthritis, psoriasis, renal osteodystrophy, rheumatoid arthritis, scleroderma, seborrheic dermatitis, skin cancer, systemic lupus erythematosus, ulcerative colitis and wrinkles; by administering to
15 a mammal in need thereof a pharmaceutically effective amount of a compound of Formula I.

20

DETAILED DESCRIPTION OF THE INVENTION

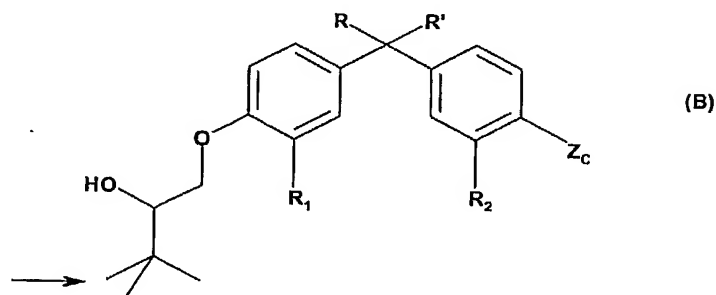

Definitions:

25 The term "branched C₃-C₅ alkyl" is an alkyl group selected from 1-methylethyl; 1-methylpropyl; 2-methylpropyl; 1,1-dimethylethyl; 1,1-dimethylpropyl; 1,2-dimethylpropyl; or 2,2-dimethylpropyl. Preferred branched C₃-C₅ alkyl groups are 2-methylpropyl and 1,1-dimethylethyl, with the 1,1-dimethylethyl group being most preferred.

30 The term, "branched alkyl terminated group" is used to identify the substituent Z_B of Formula I of the Invention. The defining characteristic of the branched alkyl

-5-

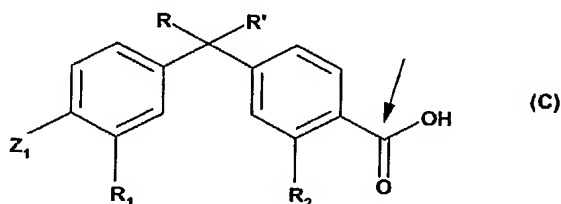

terminated group is that its terminal group is a branched C₃-C₅ alkyl, as previously defined. For example, in the structural formula (B);

- 5 the arrow identifies the terminal branched C₃-C₅ alkyl substituent of the group Z_B.

The term, "carbon atom linked group" is used to identify the chemical substituent Z_C in the Formula I definition of compounds of the invention. Its defining characteristic is a carbon atom as the first atom and point of attachment to the aryl ring to which it is attached. For example in the structural formula (C):

10

the arrow identifies the carbon atom linked directly to the aryl nucleus of formula (I). All compounds of the invention contain a carbon atom linked group as the Z_C substituent.

- 15 The term "alkenyl" refers to aliphatic groups wherein the point of attachment is a carbon-carbon double bond, for example vinyl, 1-propenyl, and 1-cyclohexenyl. Alkenyl groups may be straight-chain, branched-chain, cyclic, or combinations thereof, and may be optionally substituted. Suitable alkenyl groups have from 2 to about 20 carbon atoms.

- 20 The term "C₁-C₅ alkyl" refers to saturated aliphatic groups including straight-chain, branched-chain, and cyclic groups and any combinations thereof. Alkyl groups may further be divided into "primary", "secondary", and "tertiary" alkyl groups. In primary alkyl groups, the carbon atom of attachment is substituted with zero (methyl) or one organic radical. In secondary alkyl groups, the carbon atom of attachment is substituted with two organic radicals. In tertiary alkyl groups, the carbon atom of attachment is

-6-

substituted with three organic radicals. Examples of C₁-C₅ alkyl groups are methyl, ethyl, n-propyl, from 1-methylethyl; n-butyl, 1-methylpropyl; 2-methylpropyl; 1,1-dimethylethyl; n-amyl, 1,1-dimethylpropyl; 1,2-dimethylpropyl; and 2,2-dimethylpropyl.

The term "cycloalkyl" includes organic radicals such as cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl.

The term, "cycloalkenyl" includes organic radicals such as cyclopropenyl, cyclobutenyl, cyclopentenyl and cyclohexenyl.

The term, "C₁-C₅ fluoroalkyl" is an alkyl group containing fluorine and includes organic radicals such as -CF₃, -CHF₂, -CH₂F, -CF₂CF₃, -CHF₂CF₃, -CH₂CF₃, -CH₂CHF₂, and -CH₂CH₂F, with -CF₃ being preferred.

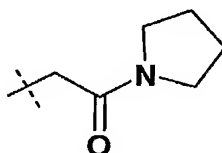

The abbreviation, "Me" means methyl.

The abbreviation, "Et" means ethyl.

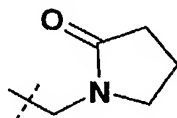

The abbreviation, "iPr" means 1-methylethyl.

The abbreviation, "tBu" means 1,1-dimethylethyl.

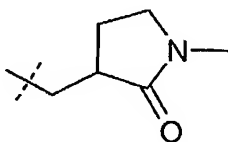

The symbol, "-CH₂-C(O)-N-pyrrolidine" refers to the radical represented by the formula:

The symbol, "-CH₂-N-pyrrolidin-2-one" refers to the radical represented by the formula:

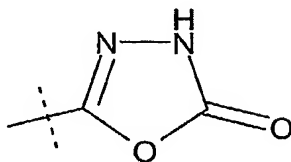

The symbol, "-CH₂-(1-methylpyrrolidin-2-one-3-yl)" is the organic radical represented by the structural formula:

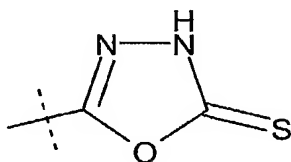

P-15440

-7-

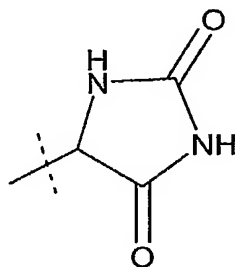

The symbol, "1,3,4-oxadiazolin-2-one-5-yl" is the organic radical represented by the formula:

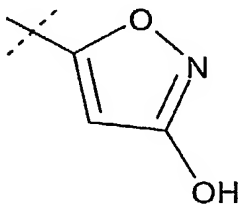

5 The symbol, "1,3,4-oxadiazolin-2-thione-5-yl" is the organic radical represented by the formula:

The symbol, "imidazolidine-2,4-dione-5-yl" is the organic radical represented by the formula:

10 The symbol, "isoxazol-3-ol-5-yl" is the organic radical represented by the formula:

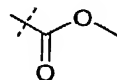

The dotted line symbol crossing a solid line representing a bond

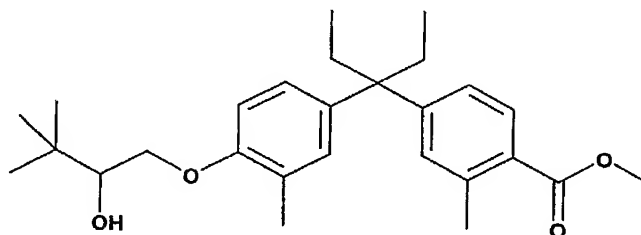

-8-

means that the bond so marked is the bond attached to the nucleus of formula (I) of the parent molecule or to a divalent linking group that is attached to the nucleus of the parent molecule. For example, the group;

5

is attached to the parent diaryl nucleus to provide a compound of the invention as shown;

10 The term, "mammal" includes humans.

The term "ester" refers to compounds of the general formula; $RO-C(O)R'$, prepared for example, where a hydroxy group of an acid is replaced with an alkoxide group. For example, a carboxylic ester is one in which the hydroxy group of a carboxylic acid is replaced with an alkoxide. Esters may derive from any acid comprising one or
 15 more hydroxy groups: for example, carbonic acid, carbamic acids, phosphonic acids, and sulfonic acids.

The term "halo" refer to fluorine, chlorine, bromine, and iodine.

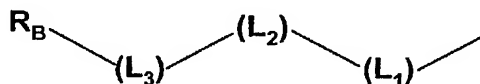

Compounds of the Invention:

20 The compounds of the invention with vitamin receptor modulating (VDRM) activities are represented by formula (I) or a pharmaceutically acceptable salt or a prodrug derivative thereof:

(II)

R and R' are independently C₁-C₅ alkyl, C₁-C₅ fluoroalkyl, or together R and R' form a substituted or unsubstituted, saturated or unsaturated carbocyclic ring having from 3 to 8 carbon atoms;

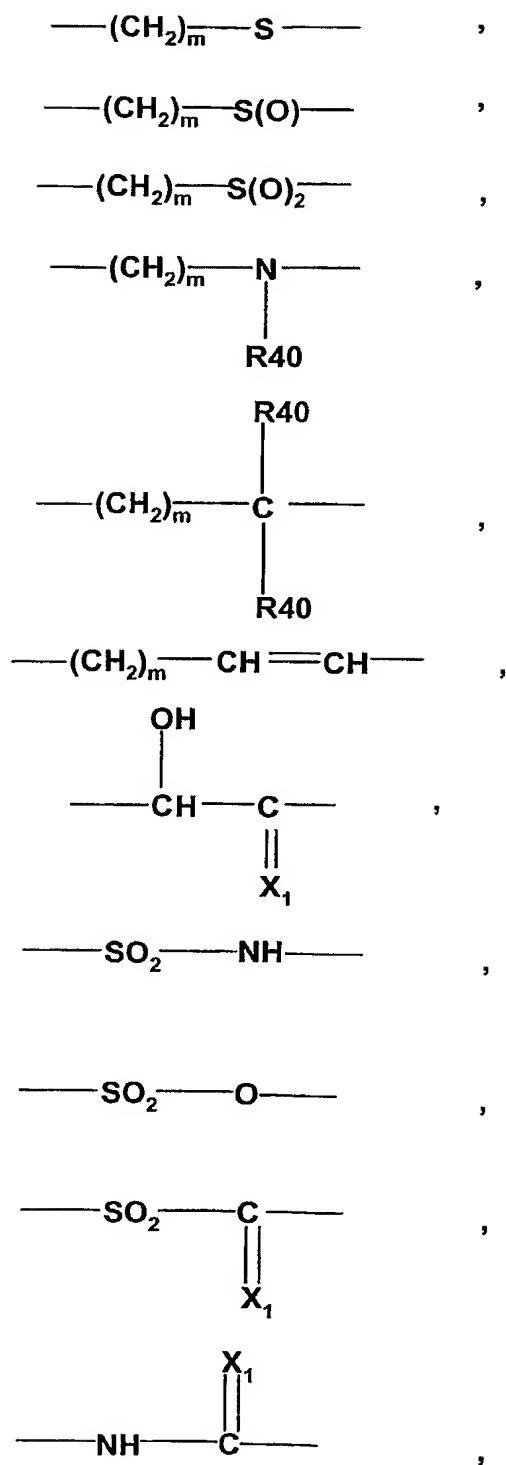

10 Z_B is a branched alkyl terminated group represented by the formula:

15 -(L₁)- and -(L₂)- and -(L₃)- are divalent linking groups independently selected from the group consisting of

$$\begin{array}{c} \text{X}_1 \\ || \\ \text{---}(\text{CH}_2)_m\text{---C---} \\ | \\ \text{OH} \\ \text{---}(\text{CH}_2)_m\text{---CH---} \\ | \\ \text{O} \\ \text{---}(\text{CH}_2)_m\text{---O---} \end{array}$$

-10-

-11-

where m is 0, 1 or 2, X₁ is oxygen or sulfur, and each R₄₀ is independently hydrogen or C₁-C₅ alkyl or C₁-C₅ fluoroalkyl;

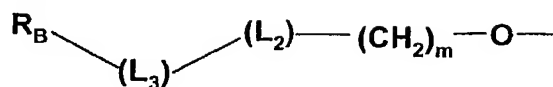

R_B is a branched C₃-C₅ alkyl; and

- 5 Z_C is selected from CO₂Me, CO₂H, C(O)NH₂, C(O)NMe₂, 5-tetrazolyl, C(O)-NH-5-tetrazolyl, C(O)NHCH₂SO₂Me, C(O)NHCH₂S(O)Me, C(O)NHCH₂CH₂SO₂Me, C(O)NHCH₂CH₂S(O)Me, C(O)NHSO₂Me, C(O)NHS(O)Me, C(O)NHSO₂Et, C(O)NHS(O)Et, C(O)NHSO₂iPr, C(O)NHS(O)iPr, C(O)NHSO₂tBu, C(O)NHS(O)tBu, CH₂NHSO₂Me, CH₂NHS(O)Me, CH₂NHSO₂Et, CH₂NHS(O)Et,
- 10 CH₂NHSO₂iPr, CH₂NHS(O)iPr, CH₂NHSO₂tBu, CH₂NHS(O)tBu, CH₂-N-pyrrolidin-2-one, CH₂-(1-methylpyrrolidin-2-one-3-yl), CH₂CO₂Me, CH₂CO₂H, CH₂C(O)NH₂, CH₂C(O)NMe₂, CH₂C(O)-N-pyrrolidine, CH₂-5-tetrazolyl, C(O)C(O)OH, CH(OH)C(O)OH, C(O)C(O)NH₂, CH(OH)C(O)NH₂, C(O)C(O)NMe₂, CH(OH)C(O)NMe₂, CH₂CH₂CO₂H, CH₂CH₂C(O)NH₂, CH₂CH₂C(O)NMe₂,
- 15 CH₂CH₂-5-tetrazolyl, CH₂S(O)₂Me, CH₂S(O)Me, CH₂CH₂S(O)₂Me, CH₂CH₂S(O)Me, CH₂CH₂CH₂S(O)₂Me, CH₂CH₂CH₂S(O)Me, CH₂S(O)₂Et, CH₂S(O)Et, CH₂CH₂S(O)₂Et, CH₂CH₂S(O)Et, CH₂CH₂CH₂S(O)₂Et, CH₂CH₂CH₂S(O)Et, CH₂S(O)₂iPr, CH₂S(O)iPr, CH₂CH₂S(O)₂iPr, CH₂CH₂S(O)iPr, CH₂S(O)₂tBu, CH₂S(O)tBu, CH₂CH₂S(O)₂tBu, CH₂CH₂S(O)tBu,
- 20 CH₂CH₂S(O)₂NH₂, CH₂CH₂S(O)NH₂, CH₂CH₂S(O)₂NMe₂, CH₂CH₂S(O)NMe₂, C(O)CH₂S(O)₂Me, C(O)CH₂S(O)Me, C(O)CH₂CH₂S(O)₂Me, C(O)CH₂CH₂S(O)Me, C(O)CH₂CH₂S(O)₂Me, C(O)CH₂CH₂S(O)Me, -CH₂NHCH₂CH₂SO₂CH₃, 1,3,4-oxadiazolin-2-one-yl, imidazolidine-2,4-dione-yl, isoxazol-3-ol-yl, or 1,3,4-oxadiazolin-2-thione-yl.
- 25

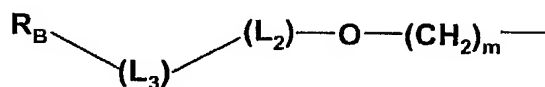

In the preceding formula I the divalent linking groups -(L1)- and -(L2)- and -(L3)- are understood (in the case of those having more than one substituent) to be oriented in either direction, for example, where divalent linker (L1) has the identity

-12-

-(CH₂)_m-O-, it may be configured:

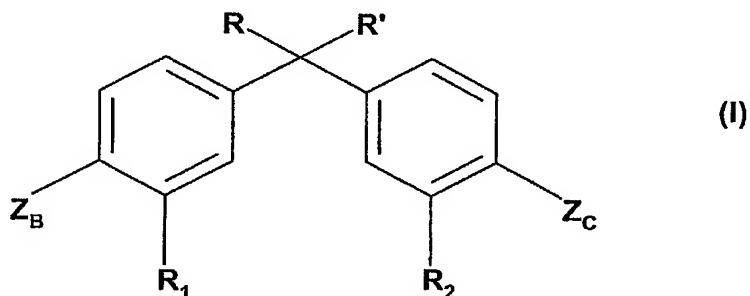

or

5

Preferred compounds of the invention with VDR modulating activities are represented by formula (I) or a pharmaceutically acceptable salt or a prodrug derivative thereof:

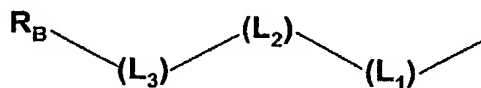

10

wherein;

R and R' are independently methyl, ethyl, propyl, 1-methylethyl, 1-methylpropyl, 2-methylpropyl, or 1,1-dimethylethyl;

15 R₁ and R₂ are independently selected from the group consisting of hydrogen, fluoro, -Cl, -CF₃, -CH₂F, -CHF₂, methoxy, ethoxy, vinyl, methyl, ethyl, propyl, 1-methylethyl, 1,1-dimethylethyl, butyl, 1-methylpropyl, 2-methylpropyl, or cyclopropyl;

Z_B is a branched alkyl terminated group represented by the formula:

20 wherein (L₁) and (L₂) and (L₃) are divalent linking groups where

-13-

L_1 is $-O-$ or $-CH_2-$;

L_2 is $-CH_2-$ or $-CH(Me)-$;

L_3 is $-C(O)-$, $-CHOH-$, or $-C(Me)OH-$;

R_B is a branched C_3-C_5 alkyl; and

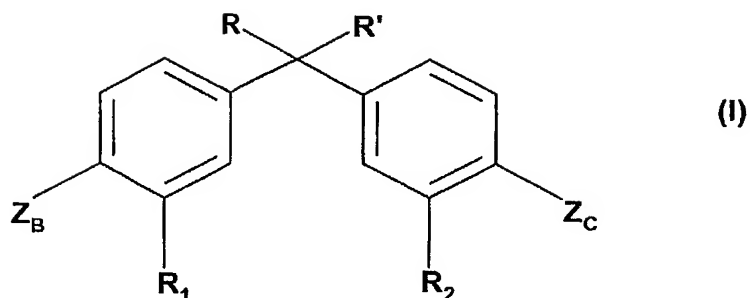

- 5 Z_C is selected from CO_2Me , CO_2H , $C(O)NH_2$, $C(O)NMe_2$, 5-tetrazolyl, $C(O)-NH-5-tetrazolyl$, $C(O)NHCH_2SO_2Me$, $C(O)NHCH_2S(O)Me$, $C(O)NHCH_2CH_2SO_2Me$, $C(O)NHCH_2CH_2S(O)Me$, $C(O)NHSO_2Me$, $C(O)NHS(O)Me$, $C(O)NHSO_2Et$, $C(O)NHS(O)Et$, $C(O)NHSO_2iPr$, $C(O)NHS(O)iPr$, $C(O)NHSO_2tBu$, $C(O)NHS(O)tBu$, CH_2NHSO_2Me , $CH_2NHS(O)Me$, CH_2NHSO_2Et , $CH_2NHS(O)Et$,
 10 CH_2NHSO_2iPr , $CH_2NHS(O)iPr$, CH_2NHSO_2tBu , $CH_2NHS(O)tBu$, CH_2-N -pyrrolidin-2-one, $CH_2-(1-methylpyrrolidin-2-one-3-yl)$, CH_2CO_2Me , CH_2CO_2H , $CH_2C(O)NH_2$, $CH_2C(O)NMe_2$, $CH_2C(O)-N$ -pyrrolidine, $CH_2-5-tetrazolyl$, $C(O)C(O)OH$, $CH(OH)C(O)OH$, $C(O)C(O)NH_2$, $CH(OH)C(O)NH_2$, $C(O)C(O)NMe_2$, $CH(OH)C(O)NMe_2$, $CH_2CH_2CO_2H$, $CH_2CH_2C(O)NH_2$, $CH_2CH_2C(O)NMe_2$,
 15 $CH_2CH_2-5-tetrazolyl$, $CH_2S(O)_2Me$, $CH_2S(O)Me$, $CH_2CH_2S(O)_2Me$, $CH_2CH_2S(O)Me$, $CH_2CH_2CH_2S(O)_2Me$, $CH_2CH_2CH_2S(O)Me$, $CH_2S(O)_2Et$, $CH_2S(O)Et$, $CH_2CH_2S(O)_2Et$, $CH_2CH_2S(O)Et$, $CH_2CH_2CH_2S(O)_2Et$, $CH_2CH_2CH_2S(O)Et$, $CH_2S(O)_2iPr$, $CH_2S(O)iPr$, $CH_2CH_2S(O)_2iPr$, $CH_2CH_2S(O)iPr$, $CH_2S(O)_2tBu$, $CH_2S(O)tBu$, $CH_2CH_2S(O)_2tBu$, $CH_2CH_2S(O)tBu$,
 20 $CH_2CH_2S(O)_2NH_2$, $CH_2CH_2S(O)NH_2$, $CH_2CH_2S(O)_2NMe_2$, $CH_2CH_2S(O)NMe_2$, $C(O)CH_2S(O)_2Me$, $C(O)CH_2S(O)Me$, $C(O)CH_2CH_2S(O)_2Me$, $C(O)CH_2CH_2S(O)Me$, $C(O)CH_2CH_2S(O)_2Me$, $C(O)CH_2CH_2S(O)Me$, $-CH_2NHCH_2CH_2SO_2CH_3$, 1,3,4-oxadiazolin-2-one-yl, imidazolidine-2,4-dione-yl, isoxazol-3-ol-yl, or 1,3,4-oxadiazolin-2-thione-yl.

25

Other preferred compounds of the invention are those represented by formula I or a pharmaceutically acceptable salt or a prodrug derivative thereof:

P-15440

-14-

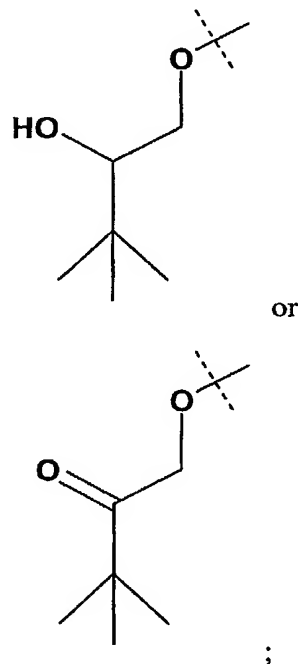

wherein;

R and R' are independently methyl or ethyl;

R₁ and R₂ are independently selected from the group consisting of hydrogen,
 5 fluoro, -Cl, -CF₃, -CH₂F, -CHF₂, methoxy, ethoxy, vinyl, methyl, or cyclopropyl;

Z_B is a branched alkyl terminated group represented by the formula:

10 Z_C is selected from

-(CH₂)-(CH₂)-C(O)-Et,

-C(O)-O-Me,

-(CH₂)-(CH₂)-C(O)-OH,

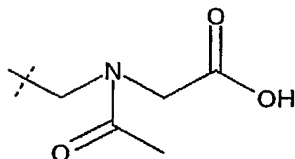

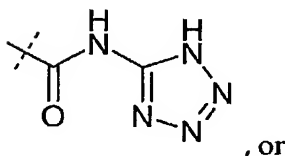

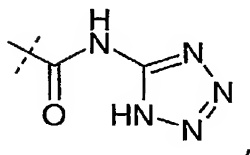

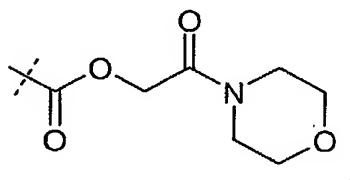

-(CH₂)-(CH₂)-C(O)-N(Me)₂,

15 -C(O)-OH,

, or

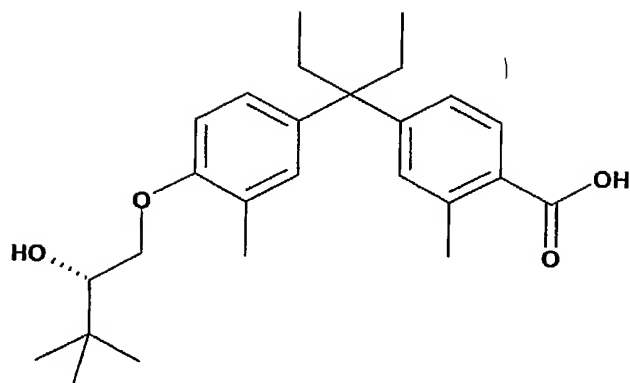

CO)

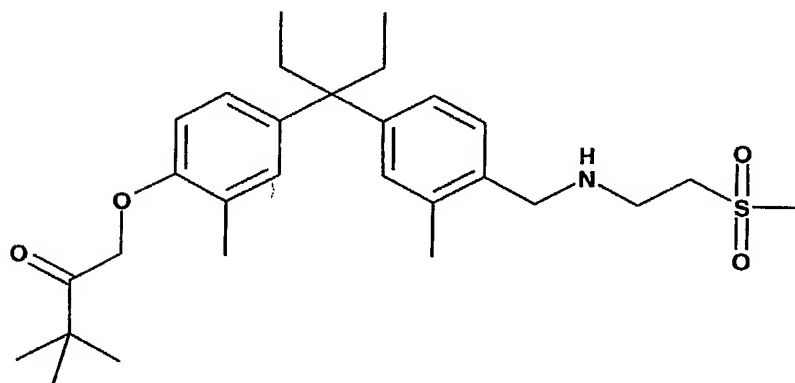

- 5 Most preferred are the individual enantiomers or a mixture of enantiomers represented by the formulae:

-37-

and

5 For all of the above compounds of the invention defined by Formula (I) the preferred prodrug derivative is a methyl ester, ethyl ester N,N-diethylglycolamido ester or morpholinylethyl ester. In addition, for all of the above compounds of the invention the preferred salt is sodium or potassium.

10 Other specific compounds that are preferred embodiments of this invention and are preferred for practicing the method of treatment of the invention are set out in the following two Tables. All numbers in the Tables cells reciting chemical species are to be understood as subscripts in chemical formulae, for example, in row, Code 11, Column, W_A, the symbol, "CO₂H" is to be understood as the conventional chemical nomenclature, -- CO₂H --. Each row of Tables 1 and 2 is a single compound having an identifying

15 "Code" (e.g., "99", "206A") defining the specific substituents in the structural formula displayed above the Tables, as follows:

Method of Making the Compounds of the Invention:

Definitions of symbols used in the Schemes:

BBr₃ – boron tribromide

BF₃-OEt₂ – boron trifluoride etherate

BnBr – benzyl bromide
CH₃CN – acetonitrile
DMAP - 4-(dimethylamino)pyridine
DMF – N,N-dimethylformamide
DMSO – dimethylsulfoxide
DPPF – dichloro[1,1'-bis(diphenylphosphino)ferrocene
DPPB – 1,4-bis(diphenylphosphino)butane
EDCI – 3-Ethyl-1-[3-(dimethylamino)propyl]carbodiimide hydrochloride
Et₃N – triethylamine
EtOH – ethanol
H₂NCH₂CO₂Me – methyl glycinate
HN(OMe)Me – N-methyl-O-methyl hydroxylamine
HNMe₂ – dimethyl amine
K₂CO₃ – potassium carbonate
KOH – potassium hydroxide
LAH – lithium aluminum hydride
LiHMDS – lithium hexamethyldisilazide
mCPBA – meta-chloroperbenzoic acid
MeI – methyl iodide
MeOH – methanol
NaBH₄ – sodium borohydride
NaH – sodium hydride
NaI – sodium iodide
NMP - N-methylpyrrolidin-2-one
Na-S-R₃ – sodium alkylmercaptide
PBr₃ – phosphorus tribromide
Pd(OAc)₂ – palladium (II) acetate
Pd-C – palladium on carbon
pTSA – para-toluenesulfonic acid
Pyr - pyridine
R₂MgBr – alkyl magnesium bromide
R₃MgBr – alkyl magnesium bromide

P-15440

-71-

R5MgBr – alkyl magnesium bromide
 R2S(O)2NH2 – alkylsulfonamide
 tBuC(O)CH2Br – 2-bromopinacolone
 Tf2O – triflic anhydride
 5 TFA – trifluoroacetic acid
 THF – tetrahydrofuran

Description of the Schemes:

Preparation of diphenyl acid and diphenyl acylaminotetrazole (Scheme 1).

- 10 A mixture of 3-substituted-4-hydroxy benzoic acid 1a and methanol is treated with HCl (gas) to yield methyl benzoate ester 1. Methyl benzoate ester 1 is reacted with excess alkyl magnesium bromide to produce tertiary alcohol 2. Tertiary alcohol 2 is converted to phenol 4 by reaction with O-benzyl-2-substituted phenol 3a and BF3-Et2O. O-benzyl-2-substituted phenol 3a is derived from reaction of 2-substituted phenol 3 with
- 15 benzylbromide and NaH. Phenol 4 is reacted with triflic anhydride/pyridine to give triflate 5 which is subjected to methoxycarbonylation with Pd(OAc)2, DPPF or DPPB, CO (100-1000 psi = 689 to 6895 kilopascals), methanol and triethylamine in either DMF or DMSO at 80-100 °C to yield methyl ester 6. Methyl ester 6 is subjected to palladium catalyzed hydrogenolysis and alkylated with NaH/pinacolone bromide to give ketone 7.
- 20 Ketone 7 is sequentially reacted with sodium borohydride/MeOH and potassium hydroxide/EtOH/ 80 °C to produce acid 8. Acid 8 is coupled with EDCI, DMAP and 5-aminotetrazole to give acylamino tetrazole 9. Acid 8 is also coupled with EDCI, DMAP and alkylsulfonamide to give acylsulfonamide 9a.

- 25 Preparation of functionalized sidechain analogs (Scheme 2).

- Ester 6 is reduced with LAH to give benzyl alcohol 10. Benzyl alcohol 10 is converted to benzylic bromide 11 with PBr3 and alkylated with the enolate of pinacolone to afford ketone 12. Ketone 12 is transformed into keto-ester 14 via Pd-C catalyzed hydrogenolysis, triflate formation with triflic anhydride/pyridine and palladium catalyzed
- 30 methoxycarbonylation. Keto-ester 14 is subjected to sodium borohydride reduction and potassium hydroxide hydrolysis to produce alcohol-acid 15.

-72-

Preparation of alkylated pinacolol sidechain (Scheme 3).

Ketone 7 is alkylated with LiHMDS/MeI and reduced with sodium borohydride to give alcohol 16. Alcohol 16 is hydrolyzed with potassium hydroxide to afford alcohol-acid 17.

5 Preparation of alkylsulfonylmethyl sidechain analogs (Scheme 4).

Benzylic bromide 11 is reacted with sodium alkylmercaptide and oxidized with mCPBA to give sulfone 18. Sulfone 18 is hydrogenolyzed with Pd-C/H₂ and alkylated with pinacolone chloride, potassium carbonate and sodium iodide to produce ketone sulfone 19. Ketone sulfone 19 is reduced with sodium borohydride to afford alcohol sulfone 20.

10

Preparation of unsymmetrical central link diphenyl scaffold (Scheme 5).

3-Substituted-4-hydroxybenzoic acid is coupled with EDCI/N-methy-N-methoxyamine/DMAP and alkylated with benzyl bromide to give amide 21. Amide 21 is sequentially reacted with R₂MgBr and R₃MgBr Grignard reagents to afford tertiary alcohol 23. Alcohol 23 is reacted with 2-substituted phenol 3 and BF₃-OEt₂ to produce diphenylalkane 24. Diphenylalkane 24 is reacted with triflic anhydride/pyridine and methoxycarbonylated with Pd(OAc)₂, DPPF or DPPB, carbon monoxide, MeOH, and Et₃N to give ester 26. Ester 26 is hydrogenolyzed with Pd-C/H₂ and alkylated with pinacolone bromide to yield ketone ester 27. Ketone ester 27 is reduced with sodium borohydride and hydrolyzed with potassium hydroxide to afford alcohol acid 28.

15

20

Preparation of tertiary alcohol sidechain analog (Scheme 6).

Phenol 4 is alkylated with pinacolone bromide and reacted with MeMgBr or EtMgBr to give alcohol 29. Alcohol 29 is hydrogenolyzed with Pd-C/H₂, reacted with triflic anhydride/pyridine and methoxycarbonylated to afford ester 30. Ester 30 is hydrolyzed with potassium hydroxide, coupled with methyl glycinate, and hydrolyzed to produce alcohol amide-acid 31.

25

Preparation of direct linked tetrazole (Scheme 7).

30 Acid 8 is reacted with formamide and sodium methoxide to give primary amide 32.

Primary amide 32 is treated with trifluoroacetic acid and methylene chloride followed by 2-chloro-1,3-dimethyl-2-imidazolinium hexafluorophosphate to give nitrile 33. Nitrile 33

-73-

is reacted with sodium azide and triethylammonium hydrochloride in N-methylpyrrolidin-2-one to afford tetrazole 34.

5

Preparation of amide (Scheme 8).

Acid 8 is reacted with diphenyl phosphorus azide and triethylamine followed by treatment with dimethylamine and 4-(dimethylamino)pyridine to yield amide 35.

10 Preparation of esters (Scheme 9).

Acid 8 is treated with sodium iodide and N,N-dimethyl-2-chloroacetamide to give ester 36. Acid 8 is treated with sodium iodide and N-morpholinocarbonylmethyl chloride to give ester 37.

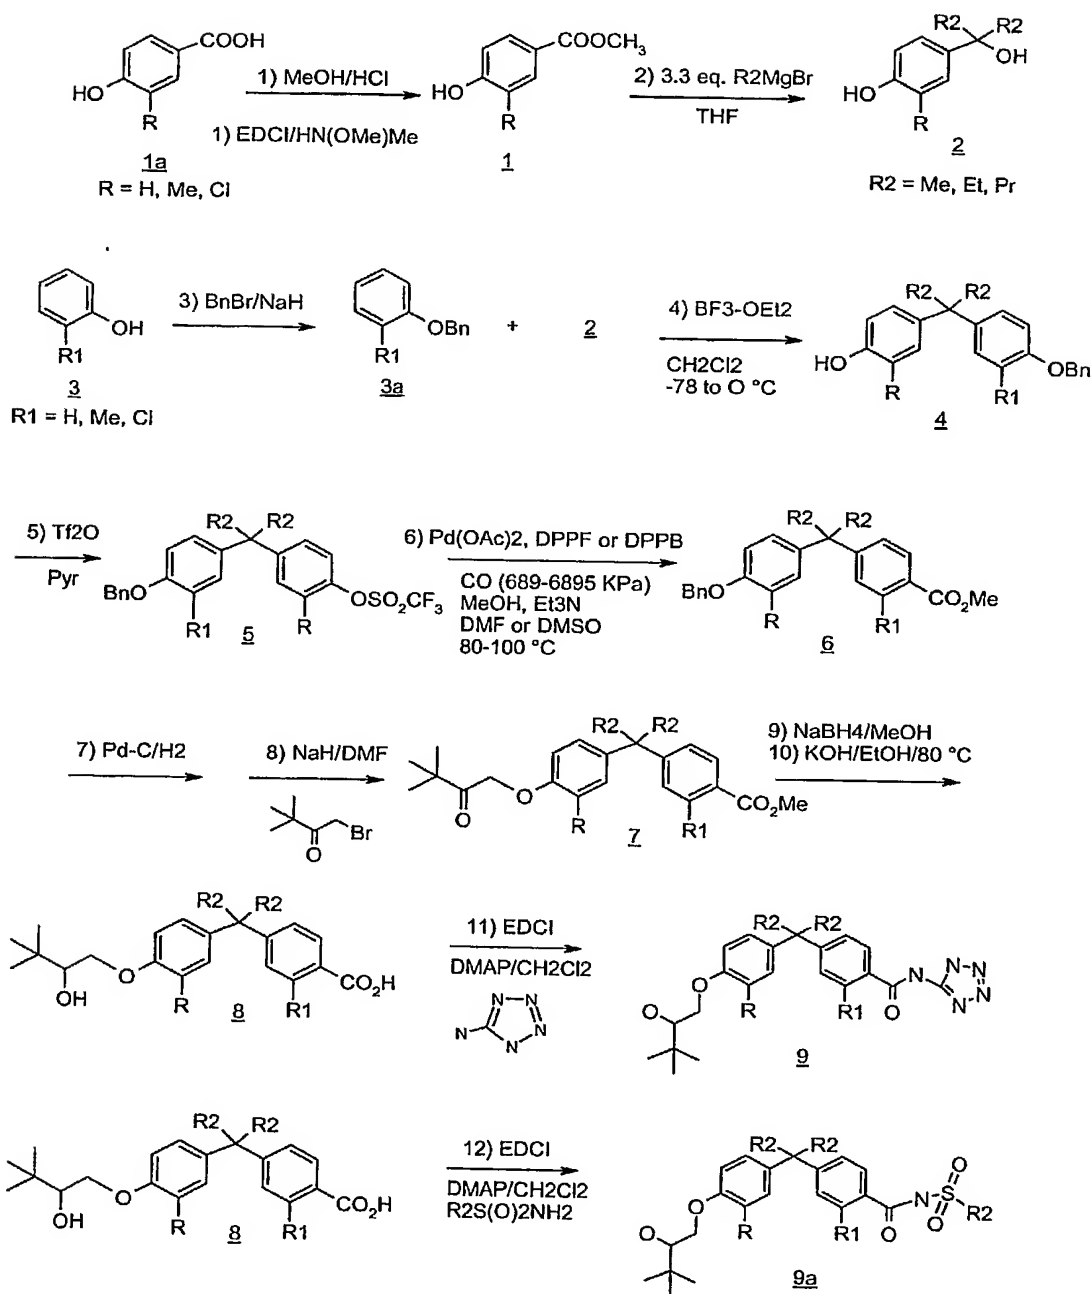

15 Alternative Synthesis of Diphenylalkyl Scaffold (Scheme 10).

Phenol 2 is heated with pTSA to give olefin 38. Olefin 38 is alkylated with 2-chloropinacolone and reacted with a 2-substituted phenol/BF₃-OEt₂ to yield phenol 40. Phenol 40 is converted to the corresponding phenolic triflate and reduced to alcohol 41. Alcohol 41 is methoxycarbonylated to afford ester 42. Ester 42 is hydrolyzed to produce
20 acid 8.

EXAMPLES

Abbreviations:

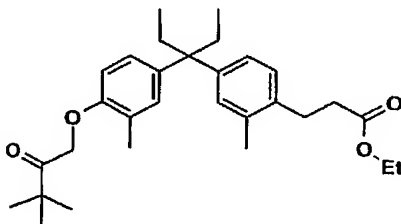

- The following examples use several standard abbreviations, for example;
- 5 “RT” is room temperature, “Rt” or t_{ret} are symbols for retention time, and “Hex” refers to hexanes

Concentration is performed by evaporation from RT to about 70°C under vacuum (1-10mm)

-81-

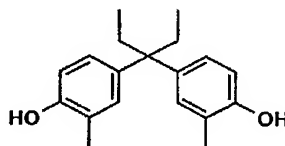

Example 1

Preparation of 3'-[4-(2-oxo-3,3-dimethylbutoxy)-3-methylphenyl]-3'-[4-(2-(ethoxycarbonyl)ethyl)-3-methylphenyl]pentane.

5 A. 3,3-Bis[4-hydroxy-3-methylphenyl]pentane.

(JB5-H6Q-107-1)

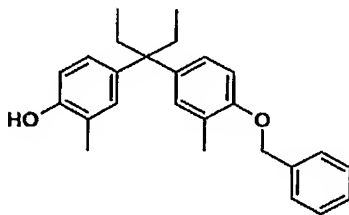

To a mixture of o-cresol (196 g, 1.81 mol) and 3-pentanone (60 ml, 0.57 mol) is added methanesulfonic acid (45 ml, 0.69 mol) with stirring for 3 days. The reaction is carefully basified to pH 8 with satd Na_2CO_3 followed by extraction with EtOAc. The organic layer is washed with water (6 X 500 ml), Na_2SO_4 dried, concentrated, chromatographed (2 kg SiO_2 , hex to 80% EtOAc/hex), and triturated with hex (hexane) to give the title compound as a white solid (100 g, 61%).

15 Compounds of the Invention – Salts, Stereoisomers, & Prodrugs:

Salts of the compounds represented by formulae (I) are an additional aspect of the invention. The skilled artisan will also appreciate that the family of compounds of formulae I include acidic and basic members and that the present invention includes pharmaceutically acceptable salts thereof.

20 In those instances where the compounds of the invention possess acidic or basic functional groups various salts may be formed which are more water soluble and physiologically suitable than the parent compound. Representative pharmaceutically acceptable salts, include but are not limited to, the alkali and alkaline earth salts such as lithium, sodium, potassium, ammonium, calcium, magnesium, aluminum, zinc, and the like. Salts are conveniently prepared from the free acid by treating the acid in solution 25 with a base or by exposing the acid to an ion exchange resin. For example, a carboxylic acid substituent on the compound of Formula I may be selected as -CO₂H and salts may be formed by reaction with appropriate bases (e.g., NaOH, KOH) to yield the corresponding sodium and potassium salt.

Included within the definition of pharmaceutically acceptable salts are the relatively non-toxic, inorganic and organic base addition salts of compounds of the present invention, for example, ammonium, quaternary ammonium, and amine cations, derived from nitrogenous bases of sufficient basicity to form salts with the compounds of this invention (see, for example, S. M. Berge, *et al.*, "Pharmaceutical Salts," *J. Phar. Sci.*, 66: 1-19 (1977)). Moreover, the basic group(s) of the compound of the invention may be reacted with suitable organic or inorganic acids to form salts such as acetate, benzenesulfonate, benzoate, bicarbonate, bisulfate, bitartrate, borate, bromide, camsylate, carbonate, chloride, choline, clavulanate, citrate, chloride, chlorprocaine, choline, diethanolamine, dihydrochloride, diphosphate, edetate, edisylate, estolate, esylate, ethylenediamine, fluoride, fumarate, gluceptate, gluconate, glutamate, glycolylarsanilate, hexylresorcinate, hydrabamine, bromide, chloride, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isothionate, lactate, lactobionate, laurate, malate, maleate, malseate, mandelate, meglumine, mesylate, mesviate, methylbromide, methylnitrate, methylsulfate, mucate, napsylate, nitrate, oleate, oxalate, palmitate, pamoate, pantothenate, phosphate, polygalacturonate, procaine, salicylate, stearate, subacetate, succinate, sulfate, tannate, tartrate, teoclate, tosylate, trifluoroacetate, trifluoromethane sulfonate, and valerate.

Certain compounds of the invention may possess one or more chiral centers and may thus exist in optically active forms. Likewise, when the compounds contain an alkenyl or alkenylene group there exists the possibility of cis- and trans- isomeric forms of the compounds. The R- and S- isomers and mixtures thereof, including racemic mixtures as well as mixtures of cis- and trans- isomers, are contemplated by this invention. Additional asymmetric carbon atoms can be present in a substituent group such as an alkyl group. All such isomers as well as the mixtures thereof are intended to be included in the invention. If a particular stereoisomer is desired, it can be prepared by methods well known in the art by using stereospecific reactions with starting materials which contain the asymmetric centers and are already resolved or, alternatively by methods which lead to mixtures of the stereoisomers and subsequent resolution by known methods. For example, a chiral column may be used such as those sold by Daicel Chemical Industries identified by the trademarks:

CHIRALPAK AD, CHIRALPAK AS, CHIRALPAK OD, CHIRALPAK OJ,
CHIRALPAK OA, CHIRALPAK OB, CHIRALPAK OC, CHIRALPAK OF,
CHIRALPAK OG, CHIRALPAK OK, and
CHIRALPAK CA-1.

5 By another conventional method, a racemic mixture may be reacted with a single enantiomer of some other compound. This changes the racemic form into a mixture of diastereomers. These diastereomers, because they have different melting points, different boiling points, and different solubilities can be separated by conventional means, such as crystallization.

10 The present invention is also embodied in mixtures of compounds of formulae I.

Prodrugs are derivatives of the compounds of the invention which have chemically or metabolically cleavable groups and become by solvolysis or under physiological conditions the compounds of the invention which are pharmaceutically active in vivo. Derivatives of the compounds of this invention have activity in both their acid and base
15 derivative forms, but the acid derivative form often offers advantages of solubility, tissue compatibility, or delayed release in a mammalian organism (see, Bundgard, H., Design of Prodrugs, pp. 7-9, 21-24, Elsevier, Amsterdam 1985). Prodrugs include acid derivatives well known to practitioners of the art, such as, for example, esters prepared by reaction of the parent acidic compound with a suitable alcohol, or amides prepared by reaction of the
20 parent acid compound with a suitable amine. Simple aliphatic or aromatic esters derived from acidic groups pendent on the compounds of this invention are preferred prodrugs. In some cases it is desirable to prepare double ester type prodrugs such as (acyloxy) alkyl esters or ((alkoxycarbonyl)oxy)alkyl esters. Particularly preferred esters to use as prodrugs are; methyl, ethyl, propyl, isopropyl, n-butyl, isobutyl, tert-butyl,
25 morpholinoethyl, and N,N-diethylglycolamido.

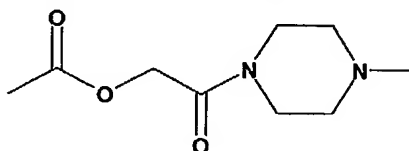

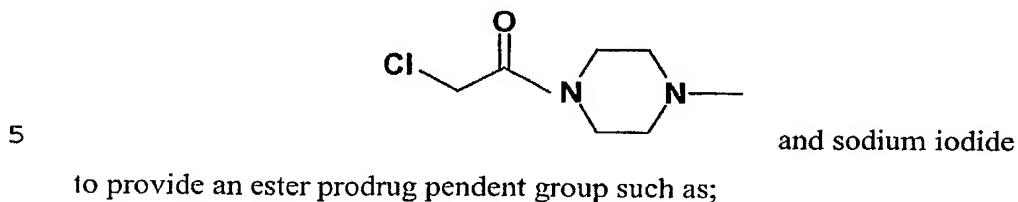

N,N-diethylglycolamido ester prodrugs may be prepared by reaction of the sodium salt of a compound of Formula (I) (in a medium such as dimethylformamide) with 2-chloro-N,N-diethylacetamide (available from Aldrich Chemical Co., Milwaukee, Wisconsin USA; Item No.25,099-6).

30 Morpholinylethyl ester prodrugs may be prepared by reaction of the sodium salt of a compound of Formula (I) (in a medium such as dimethylformamide) 4-(2-

-95-

chloroethyl)morpholine hydrochloride (available from Aldrich Chemical Co., Milwaukee, Wisconsin USA, Item No. C5,220-3).

Prodrugs, for example, may be prepared by reaction of the sodium salt for a compound of Formula I with;

Pharmaceutical Formulations containing the Novel Compounds of the Invention:

10 Pharmaceutical formulations of the invention are prepared by combining (e.g., mixing) a therapeutically effective amount of the compound of the invention (compounds of Formula I) together with a pharmaceutically acceptable carrier or diluent. The present pharmaceutical formulations are prepared by known procedures using well-known and readily available ingredients.

15 In making the compositions of the present invention, the compounds of Formula I will usually be admixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluent, it may be a solid, semi-solid or liquid material which acts as a vehicle, or can be in the form of tablets, pills, powders, lozenges, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid
20 medium), or ointment, containing, for example, up to 10% by weight of the compound. The compounds of the present invention are preferably formulated prior to administration.

The compounds of the invention may also be delivered by suitable formulations contained in a transderm patch. Alternatively, the compounds of the invention may be
25 delived to a patient by sublingual administration.

For the pharmaceutical formulations any suitable carrier known in the art can be used. In such a formulation, the carrier may be a solid, liquid, or mixture of a solid and a

-96-

liquid. Solid form formulations include powders, tablets and capsules. A solid carrier can be one or more substances which may also act as flavoring agents, lubricants, solubilisers, suspending agents, binders, tablet disintegrating agents and encapsulating material.

5 Tablets for oral administration may contain suitable excipients such as calcium carbonate, sodium carbonate, lactose, calcium phosphate, together with disintegrating agents, such as maize, starch, or alginic acid, and/or binding agents, for example, gelatin or acacia, and lubricating agents such as magnesium stearate, stearic acid, or talc.

10 In powders the carrier is a finely divided solid which is in admixture with the finely divided Active ingredient. In tablets the compound of Formula I is mixed with a carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. The powders and tablets preferably contain from about 1 to about 99 weight percent of the compound which is the novel compound of this invention.

15 Suitable solid carriers are magnesium carbonate, magnesium stearate, talc, sugar lactose, pectin, dextrin, starch, gelatin, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, low melting waxes, and cocoa butter.

 Sterile liquid form formulations include suspensions, emulsions, syrups and elixirs.

20 The compounds of the invention may be dissolved or suspended in a pharmaceutically acceptable carrier, such as sterile water, sterile organic solvent or a mixture of both. The compounds can often be dissolved in a suitable organic solvent, for instance aqueous propylene glycol. Other compositions can be made by dispersing the finely divided compounds of the invention in aqueous starch or sodium carboxymethyl

25 cellulose solution or in a suitable oil.

Methods of Using the Compounds of the Invention:

Generic disease states benefited by treatment with the compounds of Formula I include, but are not limited to:

30 disease states characterized by abnormal calcium regulation
 disease states characterized by abnormal cell proliferation
 disease states characterized by abnormal cell differentiation

-97-

- disease states characterized by abnormal immune response
disease states characterized by abnormal dermatological conditions
disease states characterized by neurodegenerative condition
disease states characterized by inflammation
5 disease states characterized by vitamin D sensitivity
disease states characterized by hyperproliferative disorders.

Specific disease states benefited by treatment of the compounds of Formula I and II
include, but are not limited to:

- 10 Acne
Actinic keratosis
Alopecia
Alzheimer's disease
Bone maintenance in zero gravity
15 Bone fracture healing

Ulcerative colitis

Vitiligo

Wrinkles

10 Particularly preferred is the treatment of psoriasis and osteoporosis by administration to a mammal (including a human) of a therapeutically effective amount of compounds of Formulae I. By "pharmaceutically effective amount" it is meant that quantity of pharmaceutical agent corresponding to formulae I which prevents, removes or reduces the deleterious effects of a disease state in mammals, including humans.

15 The specific dose of a compound administered according to this invention to obtain therapeutic or prophylactic effects will, of course, be determined by the particular circumstances surrounding the case, including, for example, the compound administered, the route of administration and the condition being treated. Typical daily doses will contain a pharmaceutically effective amount typically in the range of from about 0.0001

20 mg/kg/day to about 50 mg/kg/day of body weight of an active compound of this invention. Preferably the dose of compounds of the invention will be from 0.0001 to 5 mg/kg/day of body weight.

25 Preferably compounds of the invention (e.g., per Formula I) or pharmaceutical formulations containing these compounds are in unit dosage form for administration to a mammal. The unit dosage form can be a capsule or tablet itself, or the appropriate number of any of these. The quantity of Active ingredient in a unit dose of composition may be varied or adjusted from about 0.0001 to about 1000 milligrams or more according to the particular treatment involved. It may be appreciated that it is necessary to make routine variations to the dosage depending on the age and condition

30 of the patient. Dosage will also depend on the route of administration. The compounds of the invention may be administered by a variety of routes including oral, aerosol, rectal, transdermal, sublingual, subcutaneous, intravenous, intramuscular, and

-99-

intranasal. Particularly preferred is the treatment of psoriasis with an ointment type formulation containing the compounds of the invention. The ointment formulation may be applied as needed, typically from one to 6 times daily.

Treatment of psoriasis is preferably done with topical application by a
5 formulation in the form of a cream, oil, emulsion, paste or ointment containing a therapeutically effective amount of a compound defined by Formula (I), and in particular those compounds set out in Tables 1 or 2 or those compounds identified as "AA" to "BQ", supra. The formulation for topical treatment contains from 0.5 to 0.00005 weight percent, preferably from .05 to 0.0005 weight percent, and most
10 preferably from 0.025 to 0.001 of a compound defined by formula (I).

For example, two semisolid topical preparations useful as vehicles for VDR modulators in treatment and prevention of psoriasis are as follows:

Polyethylene Glycol Ointment USP (p. 2495)

Prepare Polyethylene Glycol Ointment as follows:

15	Polyethylene Glycol 3350	400 g.
	Polyethylene Glycol 400	<u>600 g.</u>
	To make	1000 g.

Heat the two ingredients on a water bath to 65C. Allow to cool, and stir until congealed. If a firmer preparation is desired, replace up to 100 g of
20 the polyethylene glycol 400 with an equal amount of polyethylene glycol 3350.

Hydrophilic Ointment USP (p. 1216)

Prepare Hydrophilic Ointment as follows:

	Methylparaben	0.25 g.
25	Propylparaben	0.15 g.
	Sodium Lauryl Sulfate	10 g.
	Propylene Glycol	120 g.
	Stearyl Alcohol	250 g.
	White Petrolatum	250 g.
30	Purified Water	<u>370 g.</u>
	To make about	1000 g.

The Stearyl Alcohol and White Petrolatum are melted on a steam bath, and

-100-

warmed to about 75C. The other ingredients, previously dissolved in the water are added, warmed to 75C, and the mixture stirred until it congeals.

For each of the above formulations the compound of formula (I) is added during the heating step in an amount that is from 0.5 to 0.00005 weight percent, preferably from .05 to 0.0005 weight percent, and most preferably from 0.025 to 0.001 weight percent of the total ointment weight. (Source: - United States Pharmacopoeia 24, United States Pharmacopeial Convention, 1999)

Conventional therapy for osteoporosis includes; (i) estrogens, (ii) androgens, (iii) calcium supplements, (iv) vitamin D metabolites, (v) thiazide diuretics, (vi) calcitonin, (vii) bisphosphonates, (viii) SERMS, and (ix) fluorides (see, Harrison's Principles of Internal Medicine, 13th edition, 1994, published by McGraw Hill Publ., ISBN 0-07-032370-4, pgs.2172-77; the disclosure of which is incorporated herein by reference.). Any one or combination of these conventional therapies may be used in combination with the method of treatment using compounds of Formulae I as taught herein. For example, in a method of treating osteoporosis, the vitamin D receptor modulator compounds of the invention (e.g., as defined by formula I) may be administered separately or simultaneously with a conventional therapy. Alternatively, the vitamin D receptor modulator compounds of the invention may be combined with conventional therapeutic agents in a formulation for treatment of osteoporosis such as set out below:

A formulation for treating osteoporosis comprising:

Ingredient (A1): a vitamin D receptor modulator represented by formula (I), or a pharmaceutically acceptable salt or aliphatic ester prodrug derivative thereof;

Ingredient (B1):

one or more co-agents that are conventional for treatment of osteoporosis selected from the group consisting of:

- a. estrogens,
- b. androgens,
- c. calcium supplements,
- d. vitamin D metabolites,
- e. thiazide diuretics,

-101-

- f. calcitonin,
- g. bisphosphonates,
- h. SERMS, and
- i. fluorides.

5 Ingredient (C1): optionally, a carrier or diluent.

Typically useful formulations are those wherein the weight ratio of (A1) to (B1) is from 10:1 to 1:1000 and preferably from 1:1 to 1:100.

Combination Therapy for Psoriasis:

10 Conventional therapy for psoriasis includes topical glucocorticoids, salicylic acid, crude coal tar, ultraviolet light, and methotrexate (see, Harrison's Principles of Internal Medicine, 13th edition, 1994, published by McGraw Hill Publ., ISBN 0-07-032370-4, pgs.2172-77). Any one or combination of these conventional therapies may be used in combination with the method of treatment using compounds of Formulae I as taught
15 herein. For example, in a method of treating osteoporosis, the vitamin D receptor modulator compounds of the invention (e.g., as defined by formula I) may be topically administered separately or simultaneously with a conventional therapy. Alternatively, the vitamin D receptor modulator compounds of the invention may be combined with conventional therapeutic agents in a topically applied formulation for treatment of
20 osteoporosis such as set out below:

A formulation for treating osteoporosis comprising:

Ingredient (A2): a vitamin D receptor modulator represented by formula (I), or a pharmaceutically acceptable salt or aliphatic ester prodrug derivative thereof;

25 Ingredient (B2):

one or more co-agents that are conventional for treatment osteoporosis selected from the group consisting of:

- a. topical glucocorticoids ,
- b. salicylic acid, or
- 30 c. crude coal tar.

Ingredient (C2): optionally, a carrier or diluent.

P-15440

-102-

Typically useful formulations are those wherein the weight ratio of (A2) to (B2) is from 1:10 to 1:100000 and preferably from 1:100 to 1:10000.

Explanation of Table 3 and 4 column numerical superscripts:

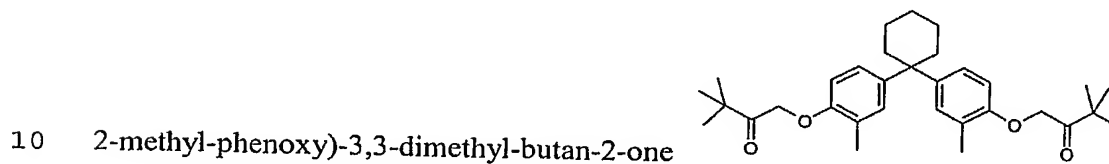

1. Test Compound coded with Example numbers correspond to the products of the same numbered example in the specification. Alphabetical symbols (e.g., "AA", "BZ") correspond to the chemical species identified by the same symbol in the specification.

"AA" = 1 α ,25-dihydroxyvitamin D₃

"BB" = 3-(4-{1-Ethyl-1-[4-(2-hydroxy-3,3-dimethyl-butoxy)-3-methyl-phenyl]-

"CC" = 1-(4-{1-[4-(3,3-Dimethyl-2-oxo-butoxy)-3-methyl-phenyl]-cyclohexyl}-

2. The RXR-VDR heterodimer assay is described in the "Assay" section of the Description, *infra*.

3. The VDR CTF (Caco-2 cells) test is described in the "Assay" section of the Description, *infra*.

-107-

4. The OCN Promoter test is described in the "Assay" section of the Description, infra.

5. The Mouse Hypercalcemia test is described in the "Assay" section of the Description, infra.

5 6. The keratinocyte proliferation assay is described in the "Assay" section of the Description, infra.

Assay Methods

Use of the Assay Methods:

10 The evaluation of the novel compounds of the invention for osteoporosis and other related diseases is done using a plurality of test results. The use of multiple assays is necessary since the combined properties of (i) high activity for the vitamin D receptor, and (ii) prevention of hypercalcemia must be achieved to have utility for the methods of treating osteoporosis related diseases, which are also, aspects of this invention. Some of
15 the tests described below measure related properties of the compounds of the invention. Since these compounds are suitable for a variety of diseases, a compound may be considered to have utility in the practice of the invention if it meets most, if not all, of the acceptance criteria for the described tests.

20 The evaluation of the novel compounds of the invention for psoriasis is done using the Keratinocyte Proliferation Assay in combination with other assays that measure Inhibition of IL-2 production and stimulation of IL-10 production in peripheral blood mononuclear cells (PBMCs).

Brief Description, Utility and Acceptance Criteria for the Assay Methods:

25 1. The RXR-VDR heterodimer Assay:

This assay provides the VDR activity of a test compound. It is desirable to have low EC50 values, since the lower the EC50 value, the more active the compound will be as a VDR agonist. This assay provides the VDR activity of a test compound. It is desirable to have low EC50 values for a compound in this assay. The lower the EC50
30 value, the more active the compound will be as a VDR agonist. Desired assay results are EC50 values less than or equal to 500 nM. Preferred assay results are less than 250 nM, and most preferably less than 150 nM.

-108-

2. The Caco-2 cell Co-transfection Assay:

The Caco-2 cell assay is an indicator for the undesirable condition of hypercalcemia. This co-transfection assay is a surrogate assay for in vivo calcemic activity of VDR ligands. It is desirable to have high EC50 values for a test compound in this assay. The higher the EC50 values for a compound the less calcemic it will be in vivo. Desired assay results are EC50 greater than or equal to 300 nM. Preferred assay results are greater than 1000 nM.

3. The OCN (osteocalcin) Promoter Assay

The OCN Promoter Assay is an indicator and marker for osteoporosis. It is desirable to have lower EC50 value in this assay since lower the EC50 of a compound, the better agonist it will be in bone. However, a non-VDR ligand may also induce osteocalcin promoter expression by acting on other promoter elements. If a compound is active in RXR-VDR heterodimerization assay and also in osteocalcin promoter assay this means that the VDR ligand is capable of inducing VDRE dependent gene expression in the target cell type. Desired assay results are EC50 less than or equal to 250 nM. Preferred assay results are less than 50 nM.

P-15440

-109-

4. The Mouse Hypercalcemia Assay

The Mouse Hypercalcemia Assay is a six day hypercalcemia test for toxicity and selectivity. Acceptable test results are levels greater than or equal to 300
5 $\mu\text{g/kg/day}$. Preferred assay results are levels greater than 1000 $\mu\text{g/kg/day}$.

5. The Keratinocyte Proliferation Assay

This Assay is indicative for the treatment of psoriasis. An acceptable test result is IC50 value of less than 200 nM. Preferred assay results are IC50 values of less than
10 100 nM.

6. The IL-10 induction Assay

This is an in vitro efficacy assay for psoriasis. Psoriasis involves both keratinocytes and immune cells. IL-10 is a unique cytokine because it is anti-inflammatory and
15 immunosuppressive This assay tells us whether a VDRM is able to function as an agonist in PBMCs (primary blood mononuclear cells) or not. A lower EC50 value is desirable in this assay since a compound with a lower EC50 value will be a better agonist in PBMCs. An acceptable test result is an EC50 value of less than 200 nM. Preferred assay results are EC50 values of less than 100 nM.

20

Details of the Assay Methods:

(1) Materials and Method for RXR-VDR Heterodimerization Assay:

Transfection Method:

25 • *FuGENE 6 Transfection Reagent* (Roche Cat # 1 814 443)

Growth Media:

• D-MEM High Glucose (Gibco BRL Cat # 11054-020), 10% FBS, 1% antibiotic-antimycotic (Ab-Am)

FBS heat inactivated (Gibco BRL Cat # 10092-147)

30 Ab-Am (Gibco BRL Cat # 15240-062)

Cells:

• Grow SaOs-2 cells in T-152 cm^2 culture flasks in *growth media*.

-110-

- Keep the density at $5-6 \times 10^5$ cells/ml
 - Passage cells 1:3 twice a week
 - Add Trypsin EDTA (Gibco BRL Cat # 25300-020) and incubate
 - Resuspend cells in plating media and transfer into growth media.
- 5 Wash Media:
- HBSS Low Glucose Without Phenol Red (Gibco BRL Cat # 14175-095), 1% Ab-Am
- Plating Media:
- D-MEM Low Glucose Without Phenol Red (Gibco BRL Cat # 11054-020), 1% Ab-Am
- D-MEM
- 10 Stripped FBS (Hyclone Cat# SH30068.03 Lot # AHM9371)
- Ab-Am
- Transfection / Treatment Media:
- D-MEM Low Glucose Without Phenol Red only
- T-152 cm² culture flask:
- 15 • Use Corning Coaster T-152 cm² culture flask (Cat # 430825) to grow the cells
- Flat well Plates:
- Use well plate to plate cells
 - Use Deep well plate sterile to make up treatment media.
- 20 Luciferase Assay Reagent:
- Use Steady-Glo Luciferase Reagent from Promega (Cat # E2550) Consists of:
 - a. E2533 Assay Substrate, lyophilized product and
 - b. E2543 Assay Buffer.
 - Thaw at room temperature
- 25 • Store
- Cell Harvesting
- Aspirate media from culture flask, rinse cells with HBSS and aspirate.
- Add trypsin and incubate.
- When cells appear detached, resuspend cells in *growth media*.
- 30 Transfer into a new flask with fresh *growth media* for passaging the cells.
- Plate well plates and two extra plates

-111-

A. Cell Count

Mix the cell suspension using pipette

Use *Hematocytometer* to count the cells

Load cell suspension onto the hemocytometer chamber

5 Count cells.

Plate seeding:

Use plating media 10 % Stripped FBS in D-MEM Low Glucose, Without Phenol Red, 1%
Ab-AmPlate 14 plates @ 165 μ l / well.10 In sterile flask add cell suspension
to *plating media*.

Mix .

Add cells / well.

Place the cells in the incubator.

15 Cells should be about 75 % confluent prior to transfection.

Step 1: DNA and Media

Add plain DMEM media to tubes for mixing the DNA

Add the Reporter gene pFR-LUC

20 Add the Gal4-RXR-DEF and VP16-VDR-LBD

Step 2: FuGENE and Media

Prepare plain DMEM media in a tubes for mixing FuGENE

Add *FuGENE 6 Transfection Reagent*

25 Incubate

Step 3: FuGENE , DNA and Media Complex

Add FuGENE Media complex from step 2 to DNA Media complex from step1

Incubate

30

Step 4: FuGENE , DNA and Media Complex to-well plate

Add FuGENE-DNA-Media complex from step 3 to each plate

P-15440

-112-

Incubate.

DAY 3: Dosing

Treatment preparation

- 5 Allow for transfection time
Make a stock solution of the compounds in DMSO
Vortex until all the compounds has been dissolved.
Further dilute in D-MEM (Low Glucose – With out Phenol Red)
Add compounds in quadruplicate to give final volume
10 Incubate.

DAY 4: Luciferase Assay

Read the plates after drug treatment

- Remove part of media from all the wells and leave remainder
15 Add Steady-Glo Luciferase Reagent mixture / wells
Incubate
Count each well using a Luminescence counter, Top Count NXT by Packard
Set a delay between plates to reduce the background

20 (2) Materials and Method for The Caco-2 Cell Assay:

- Caco-2 cells, grown in phenol red free, DMEM (Invitrogen, Carlsbad, CA) containing 10 % charcoal-stripped FCS (Hyclone, Logan, UT), are transfected with Fugene 6 reagent (Roche Diagnostics, Indianapolis, IN). Cells (5000/well) are plated 18 h before transfection in a 96 well plate. The Cells are transfected
25 with Gal4-responsive reporter pFRLuc (150 ng, Stratagene, La Jolla CA) and the receptor expression vector pGal4-VDR-LBD (10 ng), along with Fugene 6 reagent (0.2 µl/well). The DNA-Fugene complex is formed by incubating the mixture for 30 min at room temperature. The cells are transfected in triplicate for 5 h, and treated with various concentrations of VDR ligands (form 0.01 nM to
30 10,000 nM concentration range) 18h post-transfection. The luciferase activity is quantified using Steady-Glo reagent kit (Promega, Madison, WI) as per manufacturer's specifications.

P-15440

-113-

(3) Materials and Method for The OCN Promoter Assay:

The activation of osteocalcin by VDR ligands is evaluated in a rat osteoblast-like cell line RG-15 (ROS 17/2.8) stably expressing rat osteocalcin promoter
 5 fused with luciferase reporter gene. The stable cell lines are established as reported before (Activation of Osteocalcin Transcription involves interaction of protein kinase A- and Protein kinase C-dependent pathways. Boguslawski, G., Hale, L. V., Yu, X.-P., Miles, R. R., Onyia, J. E., Santerre R. F., Chandrasekhar, S. J Biol. Chem. 275, 999-1006, 2000). Confluent RG-15 cells are maintained
 10 in DMEM/F-12 medium (3:1) containing 5% FBS, 300 µg/ml G418 and at 37°C under 5% CO₂/95% air atmosphere and are trypsinized (0.25% trypsin) and plated into white opaque 96-well cell culture plates (25000 cells/well). After 24 hr, cells (in DMEM/F-12 medium + 2% FBS) are treated with various concentrations of compounds, dissolved in DMSO. The final DMSO
 15 concentration remains at 0.01% (v/v). After 48 hr treatment, the medium is removed, cells are lysed with 50 µl of lysis buffer (From Luciferase reporter assay system, Roche Diagnostics, Indianapolis, IN) and assayed for luciferase activity using the Luciferase Reporter Gene Assay kit from Boehringer Mannheim as per manufacturer's specifications.

20

(4) Materials and Method for The Mouse Hypercalcemia Assay:

Weanling, virus -antibody-free, five to six weeks old female DBF mice (Harlan, Indianapolis, IN) are used for all the studies. Animals are allowed to acclimate to local vivarium conditions for 2 days. Mice are maintained on a 12 hr light/dark cycle at 22°C
 25 with ad lib access to food (TD 5001 with 1.2% Ca and 0.9%P, Teklad, Madison, WI) and water. The animals then are divided into groups with 4-5 mice per group. Different doses of test compounds prepared in 10% Ethanol and 90% sesame oil are administered to mice orally via gavage for 6 days. 1α-25(OH)₂D₃ 0.5µg/kg/d was also given to one group of mice as the positive control. Serum ionized calcium is evaluated at 6 hours after the last
 30 dosing under isoflurane anesthesia by Ciba-Corning Ca⁺⁺/PH Analyzer, (Model 634, Chiron Diagnostics Corp., East Walpole, MA). Raw data of group differences is assessed

by analysis of variance (ANOVA) using Fisher's protected least significant difference (PLSD) where the significance level was $P < 0.05$.

(5) The Keratinocyte Proliferation Assay:

5 KERtr cells (Human skin keratinocyte transformed with a retrovirus vector, obtained from ATCC) are plated in 96-well flat-bottomed plates (3000 cells/well) in 100 μ l keratinocyte serum free medium supplemented with bovine pituitary extract in the absence of EGF (Life Technologies, Rockville, MD) and incubated at 37°C for two days. The cells are treated with various concentrations of VDR ligands (ten-fold serial dilution
10 from 10,000 nM to 0.1 nM in triplicate), dissolved in 100 μ l keratinocyte serum free medium supplemented with bovine pituitary extract in the absence of EGF and incubated at 37°C for 72hr. BrdU (5-bromo-2'-deoxyuridine) incorporation is analyzed as a measure of DNA replication (Cell proliferation ELISA kit, Roche Diagnostics, Indianapolis, IN) and absorbance is measured at 405 nm. Potency values (IC_{50}) values are determined as the
15 concentration (nM) of compound that elicited a half-maximal response.

7. Materials and Method for human IL-10 Induction Assay:

Isolation of peripheral blood mononuclear cells (PBMCs):

- A. Collect 50 ml of human blood and dilute with media, RPMI-1640.
- 20 B. Prepare sterile tubes with ficol.
- C. Add diluted blood to tubes.
- D. Centrifuge.
- E. Discard the top layer and collect the cells from middle layer.
- F. Divide all cells into four tubes and add media.
- 25 G. Centrifuge.
- H. Aspirate off media and resuspend.
- I. Collect all cells
- J. Centrifuge. at 1200 rpm for 10 minutes.
- K. Resuspend in RPMI-1640 with 2% FBS and count cells
- 30 Stimulation of PBMC:- L. Prepare TPA in DMSO.
- M. Dissolve PHA in water .

-115-

N. Plate TPA/PHA treated PBMCs in well plates.

O. Incubate.

Treatment:

P. Prepare all compound dilutions in plain RPMI- 1640 media.

5 Q. Add diluted compound.

R. Incubate.

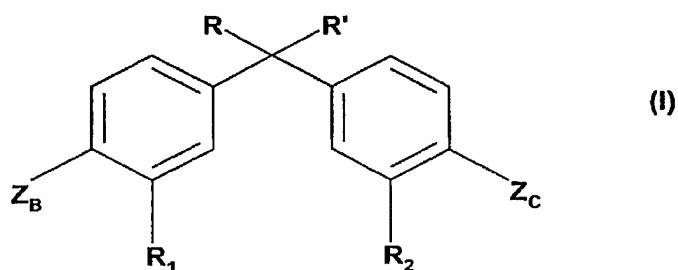

Sample Collection and assay:

S. Remove all the cells by centrifugation and assay the supernatant for IL-10 by immunoassay.

10 T. Perform IL-10 assay using anti-human IL-10 antibody coated beads, as described by the manufacturer (Linco Research Inc., St. Charles, MO)

WE CLAIM:

1. A compound represented by formula I or a pharmaceutically acceptable salt
 5 or a prodrug derivative thereof:

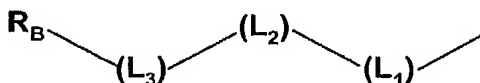

wherein;

- R and R' are independently C₁-C₅ alkyl, C₁-C₅ fluoroalkyl, or together R and R' form a substituted or unsubstituted, saturated or unsaturated carbocyclic ring having from
 10 3 to 8 carbon atoms;

R₁ and R₂ are independently selected from the group consisting of hydrogen, halo, C₁-C₅ alkyl, C₁-C₅ fluoroalkyl, -O-C₁-C₅ alkyl, -S-C₁-C₅ alkyl, -O-C₁-C₅ fluoroalkyl, -CN, -NO₂, acetyl, -S-C₁-C₅ fluoroalkyl, C₂-C₅ alkenyl, C₃-C₅ cycloalkyl, and C₃-C₅ cycloalkenyl;

- 15 Z_B is a branched alkyl terminated group represented by the formula:

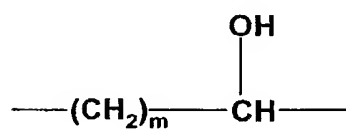

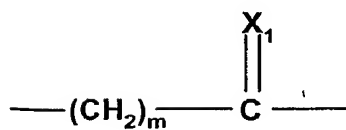

wherein

- (L₁)- and -(L₂)- and -(L₃)- are divalent linking groups independently selected
 20 from the group consisting of

-117-

a bond ,

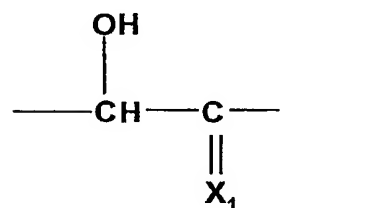

R40

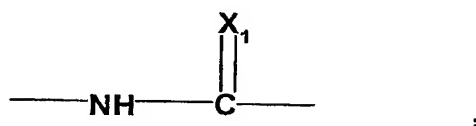

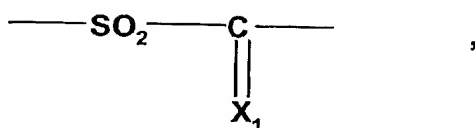

R40

R40

-118-

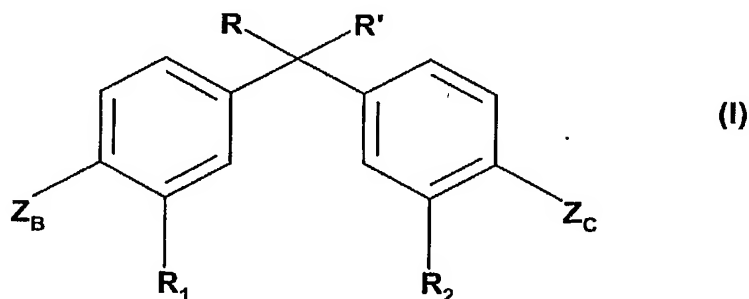

- 5 where m is 0, 1 or 2, X₁ is oxygen or sulfur, and each R₄₀ is independently hydrogen or C₁-C₅ alkyl or C₁-C₅ fluoroalkyl, R_B is a branched C₃-C₅ alkyl; and

-119-

Z_C is selected from CO_2Me , CO_2H , $C(O)NH_2$, $C(O)NMe_2$, 5-tetrazolyl, $C(O)-NH-5-tetrazolyl$, $C(O)NHCH_2SO_2Me$, $C(O)NHCH_2S(O)Me$, $C(O)NHCH_2CH_2SO_2Me$, $C(O)NHCH_2CH_2S(O)Me$, $C(O)NHSO_2Me$, $C(O)NHS(O)Me$, $C(O)NHSO_2Et$, $C(O)NHS(O)Et$, $C(O)NHSO_2iPr$, $C(O)NHS(O)iPr$, $C(O)NHSO_2tBu$, $C(O)NHS(O)tBu$, CH_2NHSO_2Me , $CH_2NHS(O)Me$, CH_2NHSO_2Et , $CH_2NHS(O)Et$, CH_2NHSO_2iPr , $CH_2NHS(O)iPr$, CH_2NHSO_2tBu , $CH_2NHS(O)tBu$, CH_2-N -pyrrolidin-2-one, CH_2 -(1-methylpyrrolidin-2-one-3-yl), CH_2CO_2Me , CH_2CO_2H , $CH_2C(O)NH_2$, $CH_2C(O)NMe_2$, $CH_2C(O)-N$ -pyrrolidine, $CH_2-5-tetrazolyl$, $C(O)C(O)OH$, $CH(OH)C(O)OH$, $C(O)C(O)NH_2$, $CH(OH)C(O)NH_2$, $C(O)C(O)NMe_2$, $CH(OH)C(O)NMe_2$, $CH_2CH_2CO_2H$, $CH_2CH_2C(O)NH_2$, $CH_2CH_2C(O)NMe_2$, $CH_2CH_2-5-tetrazolyl$, $CH_2S(O)_2Me$, $CH_2S(O)Me$, $CH_2CH_2S(O)_2Me$, $CH_2CH_2S(O)Me$, $CH_2CH_2CH_2S(O)_2Me$, $CH_2CH_2CH_2S(O)Me$, $CH_2S(O)_2Et$, $CH_2S(O)Et$, $CH_2CH_2S(O)_2Et$, $CH_2CH_2S(O)Et$, $CH_2CH_2CH_2S(O)_2Et$, $CH_2CH_2CH_2S(O)Et$, $CH_2S(O)_2iPr$, $CH_2S(O)iPr$, $CH_2CH_2S(O)_2iPr$, $CH_2CH_2S(O)iPr$, $CH_2S(O)_2tBu$, $CH_2S(O)tBu$, $CH_2CH_2S(O)_2tBu$, $CH_2CH_2S(O)tBu$, $CH_2CH_2S(O)_2NH_2$, $CH_2CH_2S(O)NH_2$, $CH_2CH_2S(O)_2NMe_2$, $CH_2CH_2S(O)NMe_2$, $C(O)CH_2S(O)_2Me$, $C(O)CH_2S(O)Me$, $C(O)CH_2CH_2S(O)_2Me$, $C(O)CH_2CH_2S(O)Me$, $C(O)CH_2CH_2S(O)_2Me$, $C(O)CH_2CH_2S(O)Me$, $-CH_2NHCH_2CH_2SO_2CH_3$, 1,3,4-oxadiazolin-2-one-yl, imidazolidine-2,4-dione-yl, isoxazol-3-ol-yl, or 1,3,4-oxadiazolin-2-thione-yl..

2. A compound represented by formula I or a pharmaceutically acceptable salt or a prodrug derivative thereof:

25 wherein;

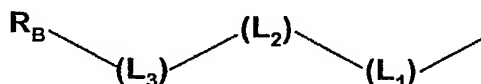

R and R' are independently methyl, ethyl, propyl, 1-methylethyl, 1-methylpropyl, 2-methylpropyl, or 1,1-dimethylethyl;

-120-

R_1 and R_2 are independently selected from the group consisting of hydrogen, fluoro, -Cl, -CF₃, -CH₂F, -CHF₂, methoxy, ethoxy, vinyl, methyl, ethyl, propyl, 1-methylethyl, 1,1-dimethylethyl, butyl, 1-methylpropyl, 2-methylpropyl, or cyclopropyl;

Z_B is a branched alkyl terminated group represented by the formula:

5

wherein (L_1) and (L_2) and (L_3) are divalent linking groups where

L_1 is -O- or -CH₂- ;

L_2 is -CH₂- or -CH(Me)- ;

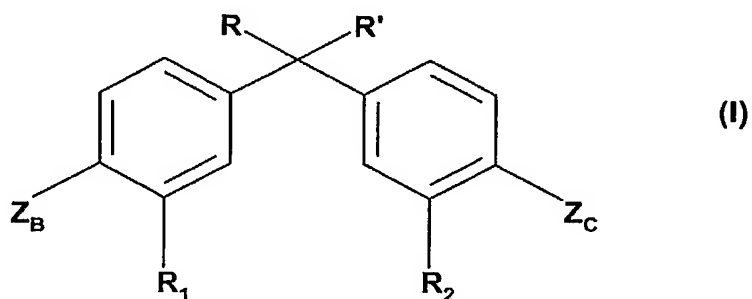

10 L_3 is -C(O)- , -CHOH- , or -C(Me)OH- ;

R_B is a branched C₃-C₅ alkyl; and

Z_C is selected from CO₂Me, CO₂H, C(O)NH₂, C(O)NMe₂, 5-tetrazolyl, C(O)-NH-5-tetrazolyl, C(O)NHCH₂SO₂Me, C(O)NHCH₂S(O)Me, C(O)NHCH₂CH₂SO₂Me, C(O)NHCH₂CH₂S(O)Me, C(O)NHSO₂Me, C(O)NHS(O)Me, C(O)NHSO₂Et, C(O)NHS(O)Et, C(O)NHSO₂iPr, C(O)NHS(O)iPr, C(O)NHSO₂tBu, C(O)NHS(O)tBu, CH₂NHSO₂Me, CH₂NHS(O)Me, CH₂NHSO₂Et, CH₂NHS(O)Et, CH₂NHSO₂iPr, CH₂NHS(O)iPr, CH₂NHSO₂tBu, CH₂NHS(O)tBu, CH₂-N-pyrrolidin-2-one, CH₂-(1-methylpyrrolidin-2-one-3-yl), CH₂CO₂Me, CH₂CO₂H, CH₂C(O)NH₂, CH₂C(O)NMe₂, CH₂C(O)-N-pyrrolidine, CH₂-5-tetrazolyl, C(O)C(O)OH, CH(OH)C(O)OH, C(O)C(O)NH₂, CH(OH)C(O)NH₂, C(O)C(O)NMe₂, CH(OH)C(O)NMe₂, CH₂CH₂CO₂H, CH₂CH₂C(O)NH₂, CH₂CH₂C(O)NMe₂, CH₂CH₂-5-tetrazolyl, CH₂S(O)₂Me, CH₂S(O)Me, CH₂CH₂S(O)₂Me, CH₂CH₂S(O)Me, CH₂CH₂CH₂S(O)₂Me, CH₂CH₂CH₂S(O)Me, CH₂S(O)₂Et, CH₂S(O)Et, CH₂CH₂S(O)₂Et, CH₂CH₂S(O)Et, CH₂CH₂CH₂S(O)₂Et, CH₂CH₂CH₂S(O)Et, CH₂S(O)₂iPr, CH₂S(O)iPr, CH₂CH₂S(O)₂iPr, CH₂CH₂S(O)iPr, CH₂S(O)₂tBu, CH₂S(O)tBu, CH₂CH₂S(O)₂tBu, CH₂CH₂S(O)tBu, CH₂CH₂S(O)₂NH₂, CH₂CH₂S(O)NH₂, CH₂CH₂S(O)₂NMe₂, CH₂CH₂S(O)NMe₂, C(O)CH₂S(O)₂Me, C(O)CH₂S(O)Me, C(O)CH₂CH₂S(O)₂Me, C(O)CH₂CH₂S(O)Me, C(O)CH₂CH₂S(O)₂Me, C(O)CH₂CH₂S(O)Me, -CH₂NHCH₂CH₂SO₂CH₃, 1,3,4-oxadiazolin-2-one-yl, imidazolidine-2,4-dione-yl, isoxazol-3-ol-yl, or 1,3,4-oxadiazolin-2-thione-yl.

-121-

3. A compound represented by formula I or a pharmaceutically acceptable salt or a prodrug derivative thereof:

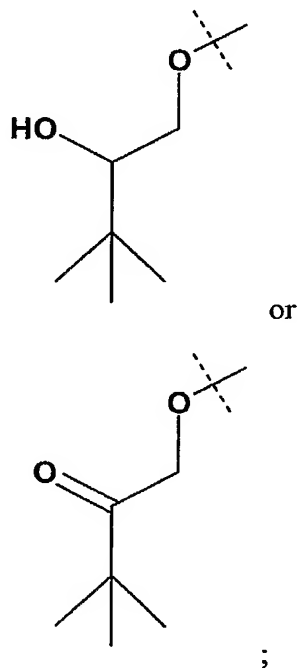

5 wherein;

R and R' are independently methyl or ethyl;

R₁ and R₂ are independently selected from the group consisting of hydrogen, fluoro, -Cl, -CF₃, -CH₂F, -CHF₂, methoxy, ethoxy, vinyl, methyl, or cyclopropyl;

Z_B is a branched alkyl terminated group represented by the formula:

10

Z_C is selected from

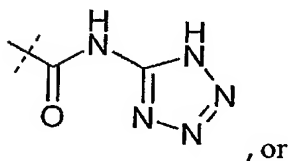

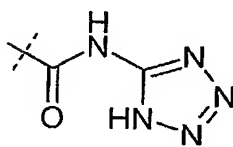

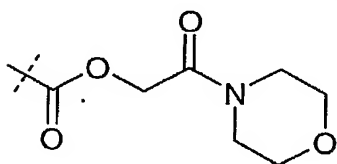

Z_C is selected from

15

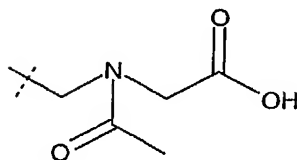

-(CH₂)-(CH₂)-C(O)-Et,

-122-

-C(O)-O-Me,
 -(CH₂)-(CH₂)-C(O)-OH,
 -(CH₂)-(CH₂)-C(O)-N(Me)₂,
 -C(O)-OH,
 5 -CH=CH-C(O)-N(Me)₂,
 -C(O)-NH-S(O)₂-Me,
 -(CH₂)-S(O)₂-Me,
 -C(O)-NH-(CH₂)-(CH₂)-OH,
 -C(O)-NH-(CH₂)-(CH₂)-S(O)₂-Me,
 10 -C(O)-NH-(CH₂)-(CH₂)-OH,
 -(CH₂)-NH-(CH₂)-(CH₂)-S(O)₂-Me,
 -C(O)-O-(CH₂)-C(O)-N(Me)₂,
 -(CH₂)-NH-(CH₂)-C(O)-O-Me,
 -C(O)-NH-(CH₂)-C(O)-OH,
 15 -CH₂NHCH₂CH₂SO₂CH₃

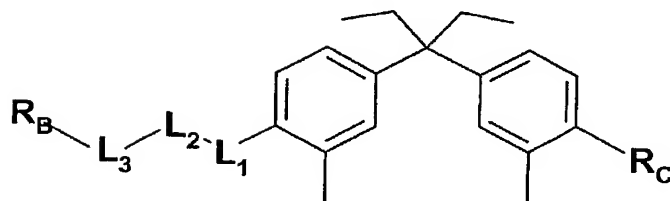

, or

20

4. A compound represented by the formula:

-123-

wherein;

- said compound is selected from a compound code numbered 1 thru 295, with each
 5 compound having the specific selection of substituents R_B , R_C , L_1 , L_2 , and L_3 shown
 in the horizontal line following the compound code number, as set out in the following
 Table 1 :

10

5. A compound represented by the formula:

P-15440

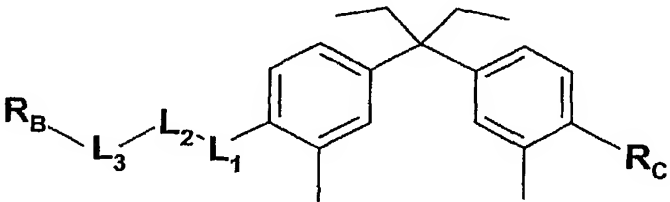

-139-

wherein;

- said compound is selected from a compound code numbered 1A thru 295A, with each
 5 compound having the specific selection of substituents R_B , R_C , L_1 , L_2 , and L_3 shown
 in the horizontal line following the compound code number, as set out in the following
 Table 2 :

Table 2

5

7. The compound represented by the formula:

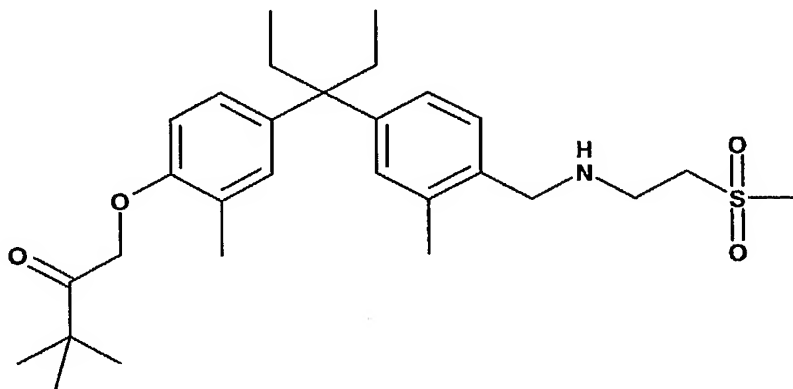

-176-

8. A compound selected from the group consisting of compounds represented by the formulae:

5

and

9. The prodrug derivative of a compound of claim 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 wherein the prodrug is a methyl ester, ethyl ester N,N-diethylglycolamido ester or morpholinylethyl ester.

10

10. The salt derivative of a compound of claim 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 wherein the salt is sodium or potassium.

-177-

11. A pharmaceutical formulation comprising a compound of claim 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 or 9 or 10 together with a pharmaceutically acceptable carrier or diluent.

- 5 12. A formulation for treating osteoporosis comprising:
- Ingredient (A1): a vitamin D receptor modulator represented by formula (I);
- Ingredient (B1):
- one or more co-agents selected from the group consisting of:
- 10 a. estrogens,
- b. androgens,
- c. calcium supplements,
- d. vitamin D metabolites,
- e. thiazide diuretics,
- 15 f. calcitonin,
- g. bisphosphonates,
- h. SERMS, and
- i. fluorides; and
- Ingredient (C1): optionally, a carrier or diluent.

20

13. The formulation of claim 20 wherein the weight ratio of (A1) to (B1) is from 10:1 to 1:1000.

14. A formulation for treating osteoporosis comprising:
- 25 Ingredient (A2): a vitamin D receptor modulator of claim 1 represented by formula (I);
- Ingredient (B2):
- one or more co-agents that are conventional for treatment osteoporosis selected from the group consisting of:
- 30 a. topical glucocorticoids ,
- b. salicylic acid,
- c. crude coal tar; and

P-15440

-178-

Ingredient (C2): optionally, a carrier or diluent.

15. The formulation of claim 14 wherein the weight ratio of (A2) to (B2) is from 1:10 to 1:100000.

5

16. A method of treating a mammal to prevent or alleviate the pathological effects of acne, alopecia, Alzheimer's disease, autoimmune induced diabetes, bone fracture healing, breast cancer, prostate cancer, colon cancer, diabetes, Type I, host-graft rejection, humoral hypercalcemia, induced diabetes, leukemia, lupus, multiple sclerosis, insufficient sebum secretion, osteomalacia, osteoporosis, insufficient dermal firmness, insufficient dermal hydration, phoriatic arthritis, psoriasis, renal failure, renal osteodystrophy, rheumatoid arthritis, scleroderma, systemic lupus erythematosus, and wrinkles; wherein the method comprises administering a pharmaceutically effective amount of at least one compound of claim 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 or 12 or 14.

10

15

17. The method of claim 12 for the treatment of psoriasis.

18. The method of claim 12 for the treatment of osteoporosis.

19. A method of treating or preventing disease states mediated by the Vitamin D receptor, wherein a mammal in need thereof is administered a pharmaceutically effective amount of a compound of Claim 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 or 12 or 14.

20

20. A compound as claimed in any one of Claims 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 or 12 or 14 for use in treating a mammal to prevent or alleviate the pathological effects of acne, alopecia, Alzheimer's disease, autoimmune induced diabetes, bone maintenance in zero gravity, bone fracture healing, breast cancer, prostate cancer, colon cancer, diabetes, Type I, host-graft rejection, humoral hypercalcemia, induced diabetes, leukemia, lupus, multiple sclerosis, insufficient sebum secretion, osteomalacia, osteoporosis, insufficient dermal firmness, insufficient dermal hydration, phoriatic arthritis, psoriasis, renal failure, renal osteodystrophy, rheumatoid arthritis, scleroderma, systemic lupus erythematosus, and wrinkles.

25

30

5

22. A compound as claimed in Claim 1 substantially as hereinbefore described with reference to any of the Examples.

23. A process for preparing a compound as claimed in claim 1 substantially as
10 hereinbefore described with reference to any of the Examples.

24. The use of a compound as claimed in claim 1 substantially as herein described with reference to any of the Assays and Tables for mediating the Vitamin D receptor.

P-15440

-180-

ABSTRACT

The present invention relates to novel, non-secosteroidal, diaryl compounds with vitamin D receptor (VDR) modulating activity that are less hypercalcemic than $1\alpha,25$ dihydroxy vitamin D₃. These compounds are useful for treating bone disease and psoriasis.
